US-09-556-605-1

Sequence 1, Application US/09556605

Patent No. 6417324

GENERAL INFORMATION:
APPLICANT: Sallberg, Matti
APPLICANT: Lazdina, Una
TITLE OF INVENTION: SYNTHETIC PEPTIDES THAT BIND TO THE
TITLE OF INVENTION: HEAPITITS B VIRUS CORE AND E ANTIGENS
FILE REPERENCE: TALEPE, 1020A
CURRENT PILING DATE: 2000-04-21

NUMBER OF SEQ ID NOS: 78

SOPTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 1

LENGTH: 119

TYPE: PRT

CREATION: ATTIFICIAL Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
Sequence 73, Application US/08478039

Sequence 73, Application US/08478039

Patent No. 5681722

GENERAL INFORMATION:

APPLICANT: Newman, Roland A.

APPLICANT: Raab, Ronald W.

TITLE OF INVENTION: Recombinant Antibodies for Human Therapy

NUMBER OF SEQUENCES: 114

CORRESPONDENCE ADDRESS:

ADDRESSEE: BURNS, DOANE, SWECKER & MATHIS

STREET: 699 Prince St.

CITY: Alexandria

STATE: VA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 73, Application US/08476349A
Patent No. 5750105
GENERAL INFORMATION:
APPLICANT: Newman, Roland A.
APPLICANT: Hanna, Nabil
APPLICANT: Raab, Ronald W.
TITLE OF INVENTION: Recombinant Antibodies for Human Therapy
NUMBER OF SEQUENCES: 114
CORRESPONDENCE ADDRESS:
APPLICANT: Newman, Roland A.
APPLICANT: Hanna, Nabil
APPLICANT: Raab, Nabil
APPLICANT: Raab, Roland W.
TITLE OF INVENTION: Recombinant Antibodies for Human Therapy
NUMBER OF SEQUENCES: 114
CORRESPONDENCE ADDRESS:
ADDRESSEE: BURNS, DOANE, SWECKER & MATHIS

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory,

```
ö
antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantizate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, theumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABB43990-ABB47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BLys; B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulant; immunomodulatory; antirheumatic; antiAIDS; vaccine; cancer; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS
inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and isseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              BLys; B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulatory; antirheumatic; antiAIDS; vaccine; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to human single exon nucleic acid probes (SENP: see AAIIO068-AAII28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human agene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical achieves. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                l probes useful for analyzing cells.
         biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumarcid arthritis, ammunodeficiency (e.g. common variable immunodeficiency (cVID) and acquired immunodeficiency suddome (ALDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                Peptide #7950 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to a single exon nucleic acid probe (SENP) (I) for measuring human gene expression in a sample derived from human adult liver, comprising one of 13109 defined nucleotide sequences given in the specification (or complements/ fragments). The probe hybridises at high stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used for predicting, measuring and displaying gene expression in samples derived from human adult liver. The genes identified may be hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia which is associated with coronary heart disease. ABG47348-ABG5930 represent human liver single exon encoded peptides of the invention. Note: The sequence information for this patent does not appear in the printed specification but was obtained, in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human adult liver.
                                                                                                                                                                                                              Human, liver, cirrhosis, hyperlipoproteinaemia; hyperlipidaemia;
hypercholesterolaemia; coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               87.8%; Score 72; DB 4; Length 92;

measure gene expression in human lung samples.

```
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expession in a sample derived from human lung comprising single exon nucleic acid probes abaving one of from human lung comprising single exon nucleic acid probes having one of from human lung comprising frames derived from the 12614 probes shich hybridise at high stringency to a nucleic complements or the 12397 open reading frames derived from the 12614 probes which hybridise at high stringency to a nucleic derived from human lung, measuring gene expression in a sample collection of detectably labeled nucleic acids derived from human lung comprising (a) contracting the array with a carray; identifying exons in a eukaryotic genome, comprising (a) agorithmically predicting at least one exon from genomic sequences of agorithmically predicting at least one exon from genomic sequences of agorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) descerting specific by hybridisation of detectably. I abeled nucleic acids from eukaryote lung mRNA, to a single exon probe, in the above mentioned microarray; assigning exons to a single exon probe, in the above mentioned microarray; assigning exons to a single exon probe of nature and (b) measuring the expression of the exons in several comprising (a) identifying exons from genomic sequence by the method comprision of the exons in the tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of the exons should be assigned to a single gene; a peptide comprising on analysis, and for identifying exons in a gene, particularly using human compression of the exons in a gene, particularly using human analysis, and for identifying exons in a gene, particularly using human control constructive pulmonary disease (ODP), interstitial lung cancer, chronic obstructive pulmonary disease (DDP), interstitial lung cancer, chronic obstructive pulmonary disease (DDP), interstitial lu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a spatially-addressable set of single exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 27; SEQ ID NO 33269; 634pp; English.

The invention relates to a peptide or polypeptide comprising an FV molecule, a construct of a construct of a fragment with endecude, a construct or a construct of a fragment with binds to a target cell in favour of other cells, where binding is consint for the cells, where binding is a single chair by determined by a first hypervariable region and FV is a single chair FV (scFV) or a disulfide FV (dsFV). The peptide, optionally in a sociation with or attached, coupled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, arcming, leukaemia, adenoma, lymphoma, myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an acute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human FV molecule hypervariable region related peptide of the invention
                                                                                                                                          Human; Fv molecule; hypervariable region; single chain Fv; cytostatic; disulfide Fv; dsFv; scFv; cancer; carcinoma; sarcoma; leukaemia; adenoma; lymphoma; myeloma; blastoma; seminoma; melanoma; acute myeloid leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel peptide/polypeptide for cancer therapy has Fv molecule, construct or fragment, or construct of fragment with enhanced binding characteristics so as to selectively bind target cell in favor of other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; antibody; epitope; cancer; tumour; cell rolling; inflammation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2×2×2×2×2×2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel polynucleotide (I) (and complements and hybridizable polynucleotides) comprising a contiguous nucleotide sequence coding for a human antibody with factor VIII specificity which has hemostatic activity. (I) is useful a primer or probe for detecting the presence of inhibitory antibodies directed against factor VIII. The polypeptides of the invention and the antibodies generated from them are useful in compositions for neutralizing factor VIII inhibiting antibodies in hemophilia A patients. This sequence represents the human factor VIII antibody A:-C1 specific scFv protein DP-15 which is used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotide, polypeptide and antibody useful for diagnosing the presence of neutralizing antibodies against factor VIII and for treatment of hemophilia A patients with these antibodies.

The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one antibody or its binding fragment having a first hypervariable region. The epitopes are useful for inhibiting cell rolling, inflammation, autoimmune classes, thrombosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increasing mortality of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-cleukaemia agents, or for decreasing the number of tumour or leukaemia cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for disgnosing and treating diseases cardiovascular diseases such as myocardial infarction, diseases and other diseases mediated by abnormal platelet function and diseases caused by sulphated tyrosine-dependent protein-protein interactions. This sequence represents a human antibody fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô

The invention describes a method of making a humanised antibody, comprising making chimeric antibodies containing a complementarity determining region (CDR) from a non-human antibody and appropriate canonical CDR structure types of non-human antibody in comparison to germine canonical CDR structure types of human antibodies as the basis of numanised antibody or a converted antibody. The method is useful for making a humanisad antibody or a converted antibody. The method is applicable for converting a subject antibody sequence of any subject species to a less immunogenic form suitable for use in an object species. The method is reliable for identifying suitable human framework sequences to support non-human CDR regions and to provide humanised antibodies that retain high antigen binding with low immunogenicity in humans, without the need for direct comparison of framework sequences, without the need for determining critically important amino acid residues in the framework, and without the need for multiple iteration and construction to obtain humanised antibodies with suitable therapeutic properties. The antibody has high affinity and low immunogenicity without need for comparing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   framework sequences between non-human and human antibodies. This sequence represents a human heavy chain variable region gene segment used in the creation of humanised antibodies
                                                                                                                                                                                                                                                                                                                                                                                            Making humanized antibody for converting antibody, by making chimeric antibodies containing complementarity determining region from non-human antibody and appropriate framework sequences of human antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Primer; PCR; amplify; human; immunoglobulin; variable; heavy chain; cosmid; placenta; vector; pJB81; E.coli; mammalian.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     chain sequences encoded by novel isolated genes. The genes (AAQ78939-7002) were isolated and cloned from a series of cosmid constructs: Y202, 7103; Y21; Y6;Y24; 3-31; M84; M18 and M131, by FCR amplification using primers AAQ78917-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA fragments were isolated from high molecular weight DNA from human placents. The DNA was partially digested with TaqI restriction enzyme. The fragments were separated by gel electrophoresis and 35-45 kb fractions were collected. The fragments were ligated with ClaI-digested cosmid vector pJB81. The fragments were ligated with ClaI-digested cosmid vector pJB81. The fragments were subcloned by colony hybridisation. The Vh genes and the DNA fragments encoding them are useful in producing human immammalian hosts. (Updated on 25-MAR-2003 to correct PN

AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid sequences of anti-adipocyte monoclonal antibody heavy chain, light chain, sequences of anti-adipocyte monoclonal antibody heavy chain, light chain, and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese parient or the antibody can be used as a therapeutic itself. Antibodies binding specifically to by complement mediated lysis. The antibodies may be labeled with a characterizable label such as radiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence or level of adipocytes in a cell or tissue sample. The antibodies can be used as an alternative means of treatment for obese patients other than undergoing surgery to remove excess fat. Antibodies for different types of fat deposits can also be produced e.g. intra-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                             Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related diseases.

Human, epidermal growth factor receptor; EGF-r; antibody; cytostatic; antiinflammatory; immunosuppressive; tyrosine phosphorylation; EGF-2; EGF-r degradation; vascular endothelial cell growth factor; VEGF; tumour; endothelial cell; threonine phosphorylation; autoimmune disease; colon; The invention relates to a specific binding agent, which comprises at least one peptide selected from any of 62 peptides (ABR55769-830) or its fragment. The binding agents are antibodies that recognize and bind to angiopoietin-2 (Ang-2). The specific binding agent, particularly the antibody, is useful for inhibiting undesired angiogenesis, treating cancers, inhibiting undesired angiogenesis, modulating or inhibiting to a cativity, modulating vascular permeability or plasma leakage, or treating a disease (e.g. ocullar neovascular disease, obesity, haemangioblastoma, haemangioma, arteriosclerosis, inflammatory disease, inflammatory disease, inflammatory disease, or psoriasis) in a mammal. The present sequence represents a heavy chain variable region of an anti-Ang-2 New specific binding agents (i.e. anti-Angiopoietin-2 antibodies), useful for inhibiting undesired angiogenesis, or treating e.g. cancers, obesity, hemangioma, arteriosclerosis, atherosclerosis or endometriosis. N-PSDB; ACD10930

Fully human monoclonal antibodies that bind to epidermal growth factor receptors, useful in cancer therapy.

Example 3; Fig 59; 100pp; English.

The invention relates to an antibody that binds to an epidermal growth factor receptor (FGF-r) and exhibits inhibition of tyrosine phosphorylation of EGF-r, the degradation of EGF-r, the EGF induced degradation of EGF-r, vascular endothelial cell growth factor (VEGF) production by tumour cells (by greater than 50%) and endothelial cells (by greater than 40%) and also protects threonine phosphorylation of EGF-r and a SIXD protein. The antibody may be used for treating tumours such as lung tumours and colon tumours and for treating inflammation and autoimmune diseases. Sequences ABO04854-ABO04859 represent human EGF-r receptor antibodies of the \*

Sequence 21, Application US/09424712

Patent No. 6620587

GENERAL INCORMATION:
APPLICANT: TAUSSIG, Michael John
APPLICANT: HE Mingyue
TITLE OF INVENTION: REDOGNE COMPLEXES AS SELECTION PARTICLES FOR IN VITRO DISPLAY AN TITLE OF INVENTION: EVOLUTION OF PROTEINS
FILE REFERENCE: 37945-0017
CURRENT APPLICATION NUMBER: 1999-11-29
CURRENT FILING DATE: 1999-11-29
PRIOR APPLICATION NUMBER: PCT/GB98/01564
                                                                                                                                                                                                                                                                                 USSOB-SEB-809A-98

Novel isolated antibody which binds to epitope on prostate specific membrane antigen, and competitively inhibits binding of second antibody to its target epitope on the antigen, useful for treating prostate cancer.

Claim 26; Page 229-230; 238pp; English.

The invention relates to an antibody or its antigen-binding fragment which specifically binds to epitope on prostate specific membrane antigen (PSMA), and competitively inhibits the specific binding of a second antibody to its target epitope on PSMA. The invention is useful for diagnosing, treating or preventing PSMA-mediated disease such as prostate cancer or non-prostate cancer bladder chosen from cancer including transitional cell carcinoma, pancreatic cancer including pancreatic duct

Novel isolated mammalian anti-tumor necrosis factor antibody, useful for treating sickle cell anemia, diabetes, atherosclerosis, restenosis, angina pectoris, myocardial infarction, leprosy.

The present sequence is that of the heavy chain variable region of anticumour necrosis factor (TMF) human mabs produced from a GenTWV fusion using raviable moells from a hybrid mouse containing human variable and constant region antibody transgenes that was immunised with high avidity and had a contain and to the human germline D-46 heavy chain sequence (see AAMS1167). The and to the human germline D-46 heavy chain sequence (see AAMS1167). The invention provides isolated human, primate, rodent, mammalian, chimmeric, humanised and/or complementarity determining region (CDR) -grafted anti-cry and variants, as well as anti-TWF antibody compositions, chimmeric, compositions, formulations, devices, transgenic animals, transgenic compositions, formulations, devices, transgenic animals, transgenic compositions, formulations, devices, transgenic animals, transgenic compositions, formulations of making and using them. The antibody complement and/or light chain variable regions given in the present sequence and in AAMS1165, or either all of the CDRs of the heavy chain and/or light chain variable regions given in the present (sequence and in AAMS1165, or either all of the CDRs of the heavy chain (see AAMS1185-60) or all of the CDRs of the heavy chain (see AAMS1185-60) or all of the CDRs of the heavy chain (see AAMS1185-60) or all of the CDRs of the heavy chain (see AAMS1185-60) or all of the CDRs of the heavy chain and arthritis, gastric ulcer, asthma, allergio rhinitis, Crohn's inhibit TMF induced cell andhesion or animal (claimed) such as rhematoid arthritis, gastric ulcer, asthma, allergio rhinitis, Crohn's pathology, sickle cell anaemia, diabetes, acardiovascular disease such as meteriosclerosis, atherosclerosis, restenosis, angina pectoria or angina pectoria or angina malignant disease such as Burkaemia, chronic myclocytic leukaemia, Burkitt's disease and configuence or a leukaemia, chronic wylelocytic leukaemia, Burkitt's andignant or sulvaemia, chronic myclocytic disease such as militared configuence or an annual e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Novel human diagnostic and therapeutic polypeptide useful for identifying test compound which specifically binds to a polypeptide encoded by human diagnostic and therapeutic polynucleotide, and to induce antibodies.

Claim 27; SEQ ID NO 1109; 591pp; English

The invention relates to novel human diagnostic and therapeutic

polynucleotides designated dithp (ACC46080-ACC46749) and to their encoded

proteins (DITHP; ABRA1812). The invention also relates to

polynucleotide sequences at least 90% identical to the dithp cDNA

sequences of the invention; recombinant vectors, host cells and

cransgenic organisms comprising althp nucleic acid sequence; the

recombinant production of DITHP proteins; antibodies specific for DITHP

crecombinant production of DITHP proteins; antibodies specific for DITHP

crecombinant production of DITHP proteins; antibodies of sereening

crecombinant production of DITHP proteins; and methods of

assessing the toxicity of test compounds using a dithp hybridiaation

crecombinant uncleic acid sequences and DITHP protein; and methods of

assessing the toxicity of test compounds using a dithp hybridiaation

crecombinant production of later compounds using a dithp hybridiaation

crecombinant production of test compounds using a dithp hybridiaation

crecombinant production of sequences and DITHP proteins may be used in the

crecompounds which specifically bind a DITHP proteins and conferences and conferences; and conferences and conferences and conferences. They may also be used to disorders; neurological disorders; partointestinal disorders; transport

crecompined above, as source of artisens sequences, as source of additionally useful in somatic or germline gene therapy of the disorders

crecompicated above, as source of antiense sequences, as a source of the generation of transgenic or mentioned above, as a source of mathiems and primers, in toxicological testing, and in transcript imaging.

The present sequence represents a DITHP protein which has antied or thumanised animals, in toxicological testing of the primers of the primed specification, but was obtained in electronic form part of the primed specification, but was obtained in electronic computation activity. Note: The sequence date for this part of the primers and primers are sequence. The

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TWS) super family and induces B cell tumour necrosis factor (TWS) super family and induces B cell proliferation and differentiation. The antibodies of the invention have proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antithermatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be associated with aberrant supersection of BLyS. They may also be ancievity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (cyll) and activity and activity and as cancer, immune, and autoimmatoid arthritis, immunodeficiency (cyll) and activity and activity and as cancer, immune (AlDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of the invention

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell correction and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, ammunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                     1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BLys; B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulant; immunosuppressive; immunostimulant; immunosi, antirheumatic; surtiAIDS; vaccine; cancer; immune alsorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.

This invention relates to a novel humanised, chimeric or human monoclonal antibody or its antigen binding portion that specifically binds to insulin-like growth factor I receptor (IGF-IR). The antibodies of the invention can act as an inhibitor of binding of IGF-IR tyrosine.

IR and can inhibit in vivo tumour growth and IGF-IR tyrosine phosphorylation. The antibodies of the invention are useful for diagnosing the presence or location of an IGF-IR-expressing tumour in a subject. The antibody or its antigen-binding portion is also useful for reating cancer in a human. The method for this further involves an antipodistic, anti-tumour, anti-anglogenic or chemotherapeutic agent. The antibodies may also be useful for Increasing IGF-IR activity and thus articles and inducing apoptosis. An antibody of the invention is also useful for inducing apoptosis of specific cells in a patient, and to treat non-cancercous states or disease, e.g. acromegaly, gigantism, or the immunogenic and allergic responses intrinsic to mouse or mouse entitied and allergic responses intrinsic to mouse or mouse and activity in a condition of the interess the efficacy and activity is a shiping an anti-local and allergic responses intrinsic to mouse or mouse carriers and antibodies and thus interess the efficacy and activity in the antibodies and thus interess the efficacy and activity in the antibodies and thus interess the efficacy and activity in the antibodies and t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel humanized, chimeric monoclonal antibody that specifically binds to insulin-like growth factor I (IGF-1) receptor useful for inhibiting binding of IGF-I or IGF-II to receptor and for treating cancer in humans.
                                                                                                                                                                                                                                                                                                                                                                                                       Insulin-like growth factor I receptor; antibody; human; cytostatic; osteopathic; antiatherosclerotic; antipsoriatic; IGF-IR; tumour; anti-neoplastic; anti-tumour; anti-angiogenic; neuropathy; osteoporosis; acromegaly; gigantism; psoriasis; atherosclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to polymucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, nematopoissis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, form the organism of interest. They can be used in diagnostics, formsics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a

Human protein SEQ ID NO 1350.

```
This invention relates to a novel humanised, chimeric or human monoclonal antibody or its antigen binding portion that specifically binds to insulin-like growth factor I receptor (IGF-IR). The antibodies of the invention can act as an inhibitor of binding of IGF-IR tyrosine phosphorylation. The antibodies of the invention are useful for its and can inhibit in vivo tumour growth and IGF-IR tyrosine phosphorylation. The antibodies of the invention are useful for diagnosing the presence or location of an IGF-IR tyrosine treating cancer in a human. The method for this further involves an antipoplastic, anti-tumour, anti-angiogenic or chemotherapeutic agent. The antibodies may also be useful for increasing IGF-IR activity and thus restoring IGF-IR activity and thus restoring IGF-IR activity and thus are sold in a nondition characterised by low IGF-IR levels e.g. neuropathy, or osteoporosis. An antibody of the invention is also useful for inducing apoptosis of specific cells in a patient, and to treat non-cancerous states or disease, e.g. acromegaly, gigantism, psoriasis and atherosclerosis. Fully human anti-IGF-IR antibodies or mouse-derivatised monoclonal antibodies and thus increase the efficacy and safety of the administered antibodies. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel humanized, chimeric monoclonal antibody that specifically binds to insulin-like growth factor I (IGF-1) receptor useful for inhibiting binding of IGF-I or IGF-II to receptor and for treating cancer in humans.
                                                                                        Insulin-like growth factor I receptor; antibody; human; cytostatic; osteopathic; antiatherosclerotic; antipsoriatic; IGF-IR; tumour; anti-neoplastic; anti-tumour; anti-anglogenic; neuropathy; osteoporosis; acromegaly; gigantism; psoriasis; atherosclerosis.
                                                         Amino acid sequence of anti-IGF-1R antibody 2.13.2 Vh domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Corvalan JR,

Claim 20; Page 3595-3596; 6221pp; English.

The invention relates to polynuclectides (AAK514156-AAK534135) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity uses useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK5281), 2111 (AAK5282) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication

```

The present invention relates to a method for inducing an immune response against B-lymphoproliferative disorders. The method comprises DNA sequences encoding for the complementarity determining region 3 (CDR3) spervariable region of immunoglobulin heavy chain (VH-CDR3) alone or in combination with at least another immunomodulating sequence. The DNA sequences are useful as therapeutic vaccines for thronic B-combinant plasmid expression vector containing a DNA sequence of a recombinant plasmid expression vector containing a DNA sequence of the invention is useful as a therapeutic vaccine or for the manufacture of invention is useful as a therapeutic vaccine or for the manufacture of a vaccine effective against chronic B-lymphoproliferative disorders expressing the surface idiotypic immunoglobulin on B-cells in mammals, preferably humans. An efficient, safe and easily reproducible DNA-based immune response against B-lymphoproliferative pathologies can be achieved. The present sequence representing human CDR3 variable region is isolated from a hairy cell leukaemia patient ö Gaps .; 0 Score 55; DB 5; Length 44; Pred. ```
The present invention describes a protein comprising an immunoglobulin CC [19] heavy chain variable (VH) domain and an IG 11ght chain variable (VL) domain. The protein binds a complex comprising a major histocompatibility complex (MHC) and a peptide, does not substantially bind the MHC in the absence of the bound peptide, and does not substantially bind the peptide in the absence of the MHC. The peptide is a peptide fragment of gp100, MUC1, TAX or MTERT. Also described: (1) a pharmaceutical composition comprising one or more nucleic acids for expressing the IG that binds a comprising one or more nucleic acids for expressing the IG that binds a comprising one or more nucleic acids for expressing the IG that binds a comprising a first segment that encodes the IG that bind the CC comprising a first segment that encodes the IG sequences that encodes the CC comprising a first segment that encodes the IG variable domain; (4) a comprising a first segment that encodes the IG variable domain; (5) a transgenic animal whose genome includes heterologous curleic acid sequences that encode the protein; (6) identifying the protein that specifically binds the MHC-peptide complex; (7) expressing an antigen-binding protein; (8) ablating or killing a target cell that complex in a sample. A protein of the invention has cytostatic actual accorded in gene therapy. The protein is useful for preparing a composition for treating or preventing a cancerous disorder in a subject; and (10) detecting an MHC-peptide composition for treating or preventing a cancerous disorder the peptide composition has experted to an MHC-peptide complex where the peptide component in as peptide complex of many component in a septide component of an antibode component of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New protein comprising an immunoglobulin heavy chain variable (VH) domain and an immunoglobulin light chain variable (VL) domain, useful for preparing a composition for treating or preventing a cancerous disorder.
                                                                                                                                                                                                                                                                                  (DYAX-) DYAX CORP.

antibody therapy

Homo sapiens. Synthetic.

```
The invention relates to an antibody that binds to an epidermal growth factor receptor (FGF-r) and exhibits inhibition of tyrosine phosphorylation of EGF-r, the degradation of EGF-r, the EGF induced degradation of EGF-r, vascular endothelial cell growth factor (VEGF) production by tumour cells (by greater than 50%) and endothelial cells (by greater than 40%) and also protects threonine phosphorylation of EGF-r and a 63M protein. The antibody is internalised with EGF-r. The antibody may be used for treating tumours such as lung tumours and colon tumours and for treating inflammation and autoimmune diseases. Sequences ABO04859 represent human EGF-r receptor antibodies of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunoglobulin; antibody; light chain; heavy chain; CDR; FR; complementarity determining region; framework region; IgBP; transgenic plant; immunoglobulin binding protein array; IgM; IgG; IgA; IgD; IgB; IgY; IgM; kappa; lambda; CHBP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes antibodies or their functional fragments that bind to TRAIL-R1 and/or TRAIL-R2. TRAIL-R1 and TRAIL-R2 antibodies have cytostatic and apoptotic activities, and can be used in antibody therapy. The antibodies can be applied as remedies and preventives of diseases due to cells expressing TRAIL-R1 and TRAIL-R2, which are useful in the therapy of malignant tumours. Remedies produced with the antibodies are highly safe, and avoid hepatotoxicity. The present sequence represents an anti-TRAIL-R antibody amino acid sequence from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                     New anti-TRAIL-R antibodies with activity of inducing apoptosis of cancer cells and without exerting an effect on normal cells expressing TRAIL-Rs nor inducing injury to hepatocytes, for use in therapy of malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, epidermal growth factor receptor; EGF-r; antibody; cytostatic; antiinflammatory; immunosuppressive; tyrosine phosphorylation; EGF-2; EGF-r degradation; vascular endothelial cell growth factor; VEGF; tumour; endothelial cell; threonine phosphorylation; autoimmune disease; colon;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Title: Perfect score: 97 Sequence: 1 gfgysynydyyygmdv 16

Scoring table: BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched: 141681 segs, 52070155 residues

Total number of hits satisfying chosen parameters: 141681

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt\_42:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

and mouse cDNA sequences.";

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

- PUNCTION: May play a role in the formation and regulation of the tight junction (TJ) paracellular permeability barrier.

- SUBGINIT: Interacts with TJP1/ZO1 and with VAPA.

- SUBGINIT: Interacts with TJP1/ZO1 and with VAPA.

- TSUBINIT: Localized at tight junctions of both epithelial and endothelial cells. Highly expressed in kidney.

Not detected in testis.

- DOMAIN: The C-terminal is cytoplasmic and is important for interaction with ZO-1. Sufficient for the tight junction of the permeability barrier function of the tight junction (By similarity).

- PTM: Phosphorylated (By similarity).

- SIMILARITY: Belongs to the ELL / occludin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | InterPro; IPKUU425... | Pean, PRO1284; MRNUEL; I. | Pean, PRO1284; MRNUEL; I. | PRO1284; MRNUEL; I. | PRO1285; OCCUUDIN. | PROMAIN | 1 66 | CYTOPLAMIC (POTENTIAL). | PUMAIN | 90 | 135 | EXTRACELLULAR (POTENTIAL). | PT PRANSKEM | 136 | 160 | POTENTIAL). | PT PRANSKEM | 136 | 160 | POTENTIAL. | PT PRANSKEM | 137 | PT PRANSKEM | 137 | PT PRANSKEM | 137 | PT PRANSKEM | 138 | EXTRACELLULAR (POTENTIAL). | PT PRANSKEM | 171 | 195 | EXTRACELLULAR (POTENTIAL). | PT PRANSKEM | 136 | 243 | EXTRACELLULAR (POTENTIAL). | POMAIN | 196 | 243 | EXTRACELLULAR (POTENTIAL). | POMAIN | 196 | 243 | EXTRACELLULAR (POTENTIAL). | POMAIN | 196 | 243 | EXTRACELLULAR (POTENTIAL). | POMAIN | 196 | 243 | EXTRACELLULAR (POTENTIAL). | POMAIN | 196 | 243 | EXTRACELLULAR (POTENTIAL). | POMAIN | 265 | PT PANSKEM | PT PA

Submirz R.C., Beintema J.J., Stam W.T., Bradfield J.Y.;

Submirted (AUG-1995) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Larval storage protein (LSP) which may serve as a st. of amino acids for synthesis of adult proteins (By similarity).

-!- SUBUNIT: Homohexamer (Potential).

-!- SUBCELLULAR LOCATION: Extracellular (By similarity).

-!- SUMILARITY; TO ARYLPHORINS AND TO ARTHROPOD HEMOCYANINS.
                                                                                                                                                                       Hexamerin precursor.

FEBS Lett. 445:137-143(1999).
-!- FUNCTION: May be involved in the production and the transport of exopolysaccharides in the production and the transport of tyrosine phosphate.
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.
-!- PATHWAY: Exopolysaccharide biosynchesis.
-!- PATHWAY: Exopolysaccharide biosynchesis.
-!- FATHWAY: Autophosphorylated on several Tyr residues. Dephosphorylated
                                                                                                                                                                                                                     SEQUENCE FROM N.A., AND CHARACTERIZATION.

Incled=064012-2; Sequence=VSP 005805;
-: TISSUE SPECIFICITY: Widely expressed in liver.

Jung, spleen and kidney. Weakly expressed in liver.

-: DEVELOPMENTAL STAGE: Expressed in the unfertilized egg, in the blastocyst, as well as in the developing embryo and fetus.

Expressed in developing skin.

-: DISBASE: Defects in RALY are the cause of lethal yellow mutation homoxygous, and pleiotropic effects when heteroxygous, including yellow pelage, obesity, non-insulin dependent diabetes and increased tumor susceptibility. A(y) is due to a 170 kb deletion that removes all but the promoter and non-coding first exon of RALY and links them to the ASIP/Agouti gene.

-: SIMILARITY: Contains 1 RNA recognition motif (RRW) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PROSITE; PS50102; RRM, 1.

Call Biol. 137:1393-1401(1997).

-!- FUNCTION: May play a role in the formation and regulation of the tight junction (TU) paracellular permeability barrier. Interacts with Zo-1.

-!- SUBUNIT: Interacts with VAPA (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -:- SUBCELLUIAR LOCATION: Integral membrane protein.
-:- SUBCELLUIAR LOCATION: Integral membrane protein.
-:- TISSUE SPECIFICTIY: Localized at tight junctions of both epithelial and emochelial cells.
-:- DOMAIN: The C-terminal is cytoplasmic and is important for interaction with ZO-1. Necessary for the tight junction localization. Involved in the regulation of the permeability barrier function of the tight junction (By similarity).
-:- PTM: PHOSPHORYLAYED. LESS PHOSPHORYLATED FORMS ARE FOUND IN BASCHATERAL MEMBRANE, CYTOSOL AND TIGHT UNCTION. MORE HEAVILY PHOSPHORYLATED FORMS ARE CONCENTRATED EXCLUSIVELY IN TIGHT
                                                                                                                                                                                                                                                                    TISSUE=Kidney;

-i-SUBCELLULAR LOCATION: Integral membrane protein.
-i-TISSUB SPECIFICITY: Localized at tight junctions of both epithelial and endothelial cells. Highly expressed in lung and liver. Expressed at a lower level in brain.
-i-DOMAIN: The C-terminal is cytoplasmic and is important for interaction with ZO-1. Necessary for the tight junction interaction with ZO-1. Necessary for the tight junction of calization. Involved in the regulation of the permeability barrier function of the tight junction. The second extracellular domain may also be implicated in the permeability barrier function of the tight junction.
-i-PTM: Phosphorylated (By similarity).
-i-SIMILARITY: Belongs to the ELL / occludin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SEQUENCE FROM N.A.
